

Abstract

In today's competitive job market, job seekers often struggle to find reliable resources for resumes, job portals, skill-building courses, and interview preparation. This project presents a **Job Seeker Resource Website** built using Python Flask to provide centralized access to these essentials. The platform offers a simple and user-friendly interface where resources are categorized for easy navigation. By streamlining access to curated materials, the system helps candidates prepare more effectively for employment opportunities.

Problem Statement

Job seekers spend significant time browsing multiple platforms for resumes, job portals, skill-development courses, and interview tips. The lack of a **centralized, organized, and easily accessible platform** creates inefficiency and confusion. This project addresses the problem by developing a **web-based solution** that aggregates these resources into a single portal, ensuring quick access, improved preparation, and better career readiness.
